

# Geophysical Study of Warm Mineral Springs Park

Assessing the Impact of Proposed Development

BY: ARDAMAN & ASSOCIATES, INC.

# Warm Mineral Springs Park

---

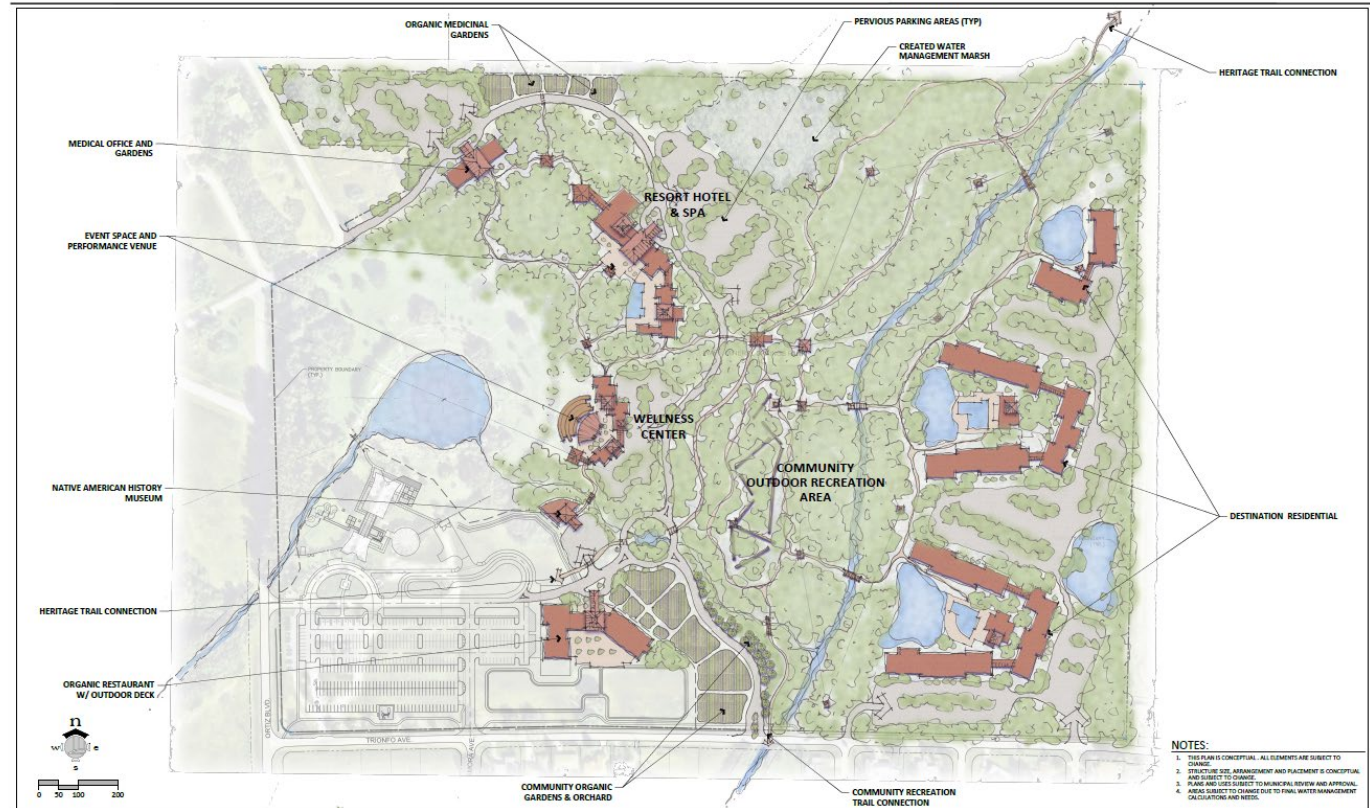

- Located in the City of North Port
- A destination for visitors from around Florida and worldwide
- A popular recreational park
- A valuable pre-historic archeological site
- Listed in the U.S. National Register of Historic Places

Source: Thomas Bender/Herald-Tribune

# Project Objectives

- Determine if development will negatively impact the spring.
- Identify underground features that might be impacted by the development.
- Development of buildings on shallow foundations with on-site stormwater ponds

Warm Mineral Springs Enclave Conceptual Plan

# Initial Methodology

---

Initially, Ardaman proposed to investigate the site using a two-phased approach that combined:

- Phase I: Ground Penetrating Radar (GPR)
- Phase II: Electrical Resistivity (ER)

After developing a plan and schedule for this two-phased approach and discussing it with the Project Team, an alternative investigative survey method was selected: **Microgravity Survey**.

# Microgravity Survey Methodology

---

- Measured changes in gravity, which are related to varying subsurface density.
- Gravity changes map subsurface features (voids versus soil).
- “Low” and “High” gravity are indicated on color-coded maps.
- Readings of about 100 uGals indicate significant anomalies
- We investigated accessible areas, excluding:
  - Provided gopher tortoise mound locations + 25-foot buffer zone
  - Protected trees
  - Eco Cabin area, restaurant, and southernmost residential building (due to above reasons)

# Advantages of Microgravity

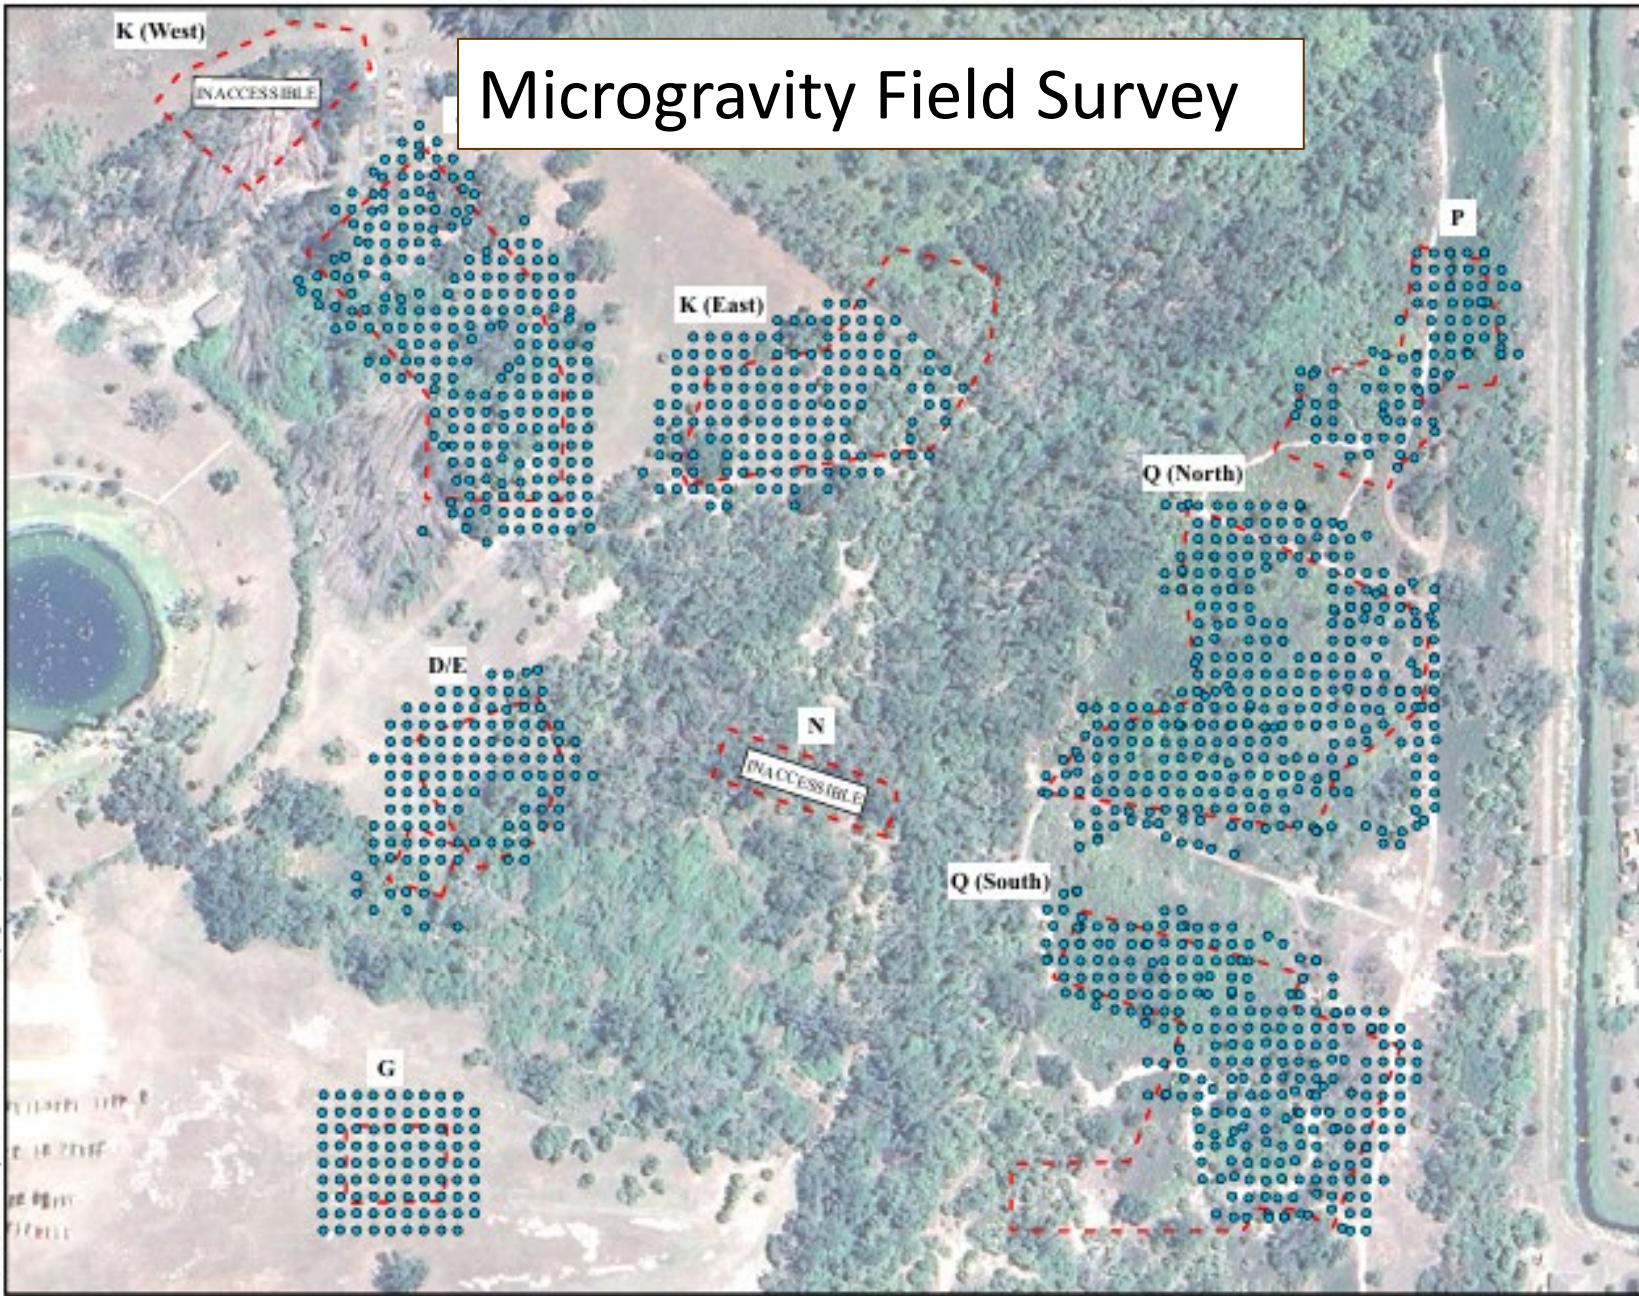

---

- Innovative technology that identifies subsurface anomalies
- Higher quality data and shorter time frame than GPR and ER.
- Specifically,
  - Initial two-phase approach included 10 GPR days and 55 ER days
  - Microgravity could cover the same area in 30 days
- Successful demonstration confirmed higher quality data.

# Microgravity Survey Results

## Residual Gravity (MicroGals)

Bound: Path: W:\Projects\0523-25-16-Tidal-Warm-Biward-Squash-Wet-Lay-out\052321-L\_Main\_Biward\_Springs.aprx

# Microgravity Findings

---

Measured Residual Gravity Values:

- “High” (Yellow to Dark Orange) = +20 to +42  $\mu\text{Gal}$
- “Background” (Light Blue to Green) = -20 to +20  $\mu\text{Gal}$
- “Low” (Violet to Dark Blue) = -53 to -20  $\mu\text{Gal}$

# Confirmatory Soil Borings

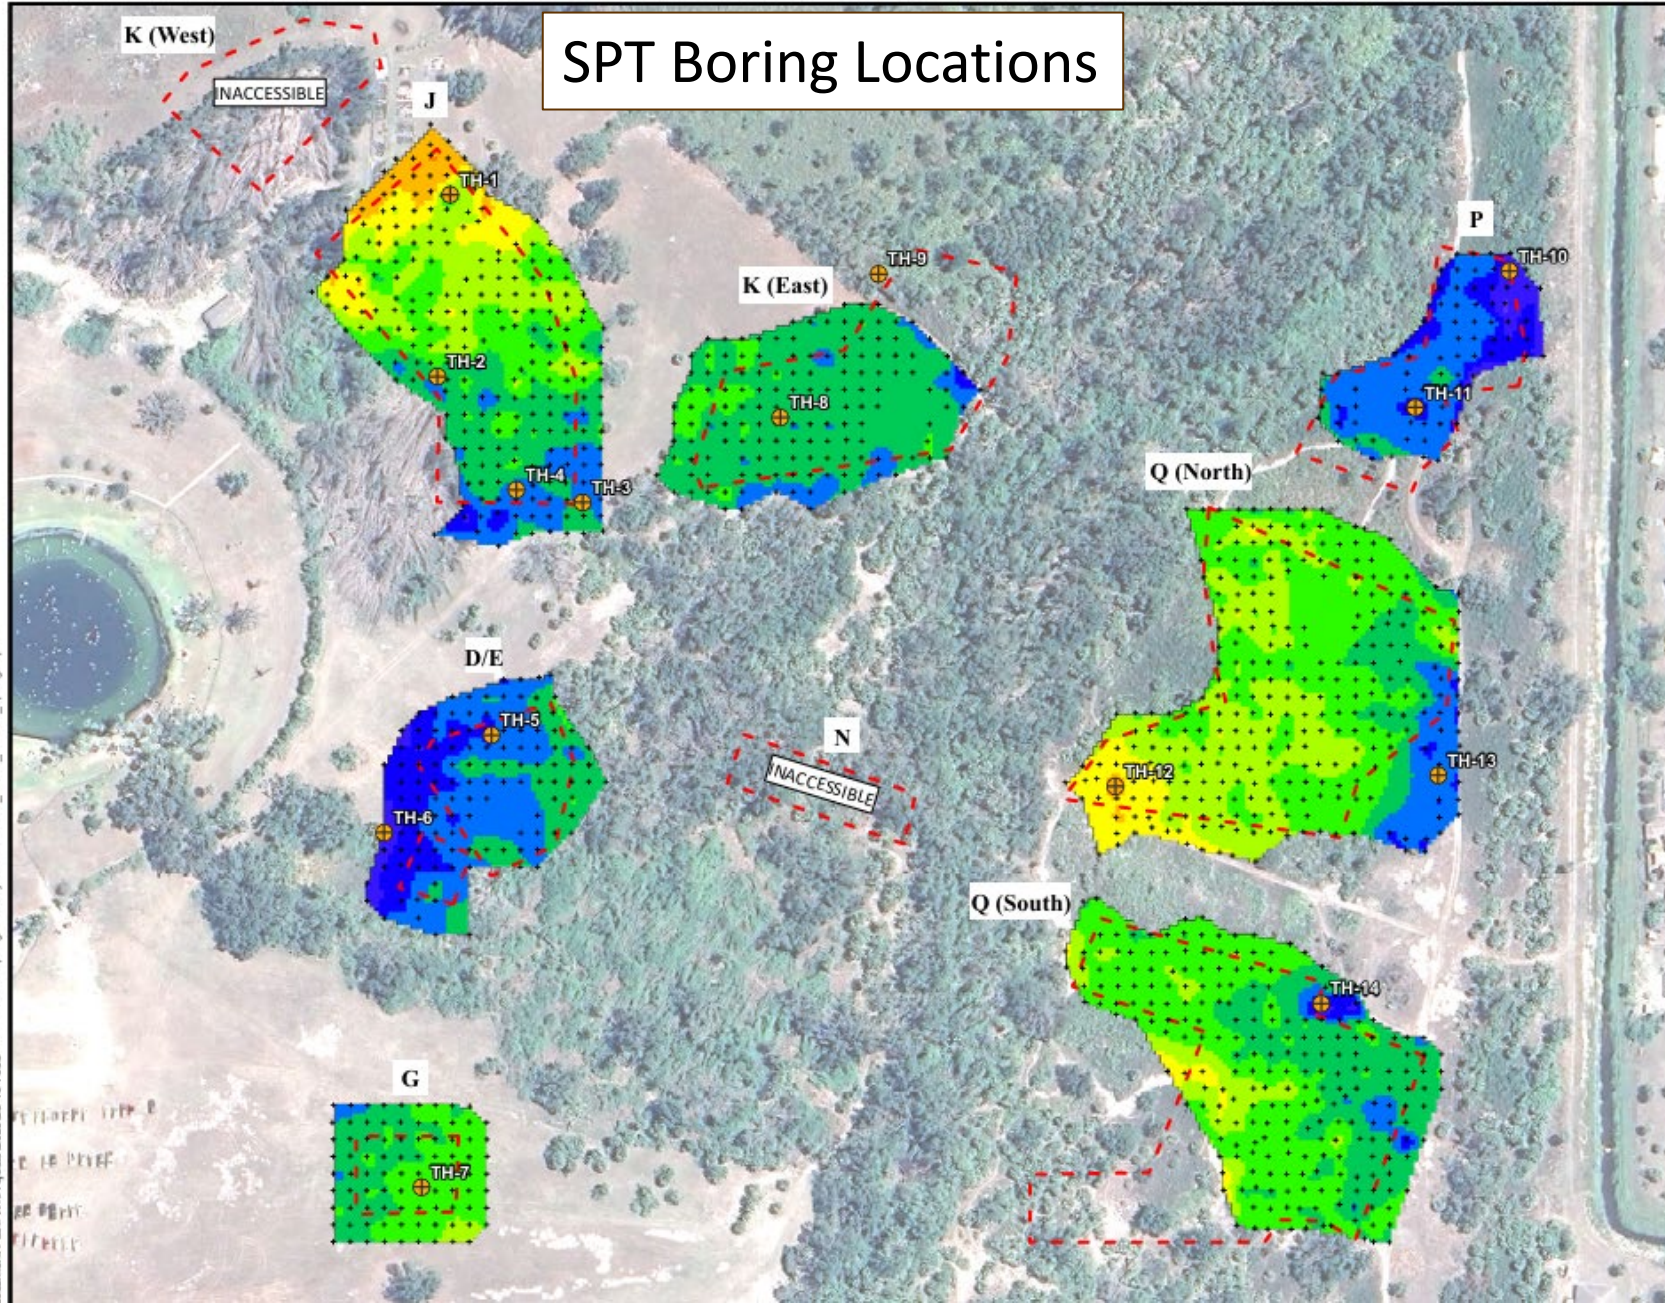

---

- Standard Penetration Test (SPT) borings,
  - Correlate SPT test results with soil properties such as density
  - Recover soil samples for analysis and classification
- Borings were placed in “low”, “high,” and “background” gravity areas
- Borings used to explore the cause of gravity variations (feeder veins, erosion features, Karst features, large voids, or differences in soil types and density).

# SPT Boring Locations

## Legend

▼ GROUNDWATER LEVEL MEASURED ON DATE DRILLED

GNM GROUNDWATER NOT MEASURED (i.e., NOT ENCOUNTERED IN THE TOP 5 FEET AND NOT MEASURED BELOW 5 FEET DUE TO THE MUDDED CONDITION OF THE BOREHOLE OR SLOW RECOVERY IN THE CLAYEY/SILTY SOILS).

— Average Water Table Elevation in “Low” and “Background” Typical Profiles

### SOIL DESCRIPTIONS

### COLORS

- |  |   |  |                             |
|--|---|--|-----------------------------|
|  | ① FINE SAND (SP)  |  | (A) LIGHT BROWN TO BROWN    |
|  | ② SILTY FINE SAND (SM)                                    |  | (B) LIGHT GRAY TO GRAY      |
|  | ③ CLAYEY FINE SAND (SC)                                   |  | (C) ORANGE-BROWN            |
|  | ④ PARTIALLY CEMENTED TO CEMENTED SILT (ML/MH), CALCAREOUS |  | (D) DARK BROWN OR DARK GRAY |
|  | ⑤ SANDY CLAY TO CLAY (CL/CH), CALCAREOUS                  |  | (E) GREENISH GRAY           |

# Summary of Confirmation Borings

---

- SPT borings conducted in each gravity area type found that the soils were consistent across the study areas.
- The only appreciable difference between borings conducted in different residual gravity areas was the water table – low residual gravity boring locations encountered lower water table elevations.
- SPT borings did not encounter conditions indicating a subsurface anomaly or discontinuity.

# Conclusions

---

- No significant subsurface anomalies (voids, caverns, feeder veins) were encountered within the zone of influence of the proposed development.
- The proposed development of buildings on shallow foundations and of shallow wet stormwater ponds would not negatively impact the Warm Mineral Springs.
- If any of the below items are planned or being considered, further exploration and evaluation would be required
  - Drain fields/septic tanks
  - Deep (i.e. pile) foundations
  - Deep water wells
  - Any development closer to the spring than what is currently proposed
